디자이너니까 오프라인용 굿즈 쯤이야! 마케팅 컨텐츠 편집 디자인

디자이너도 Vue.js를 쓸수있다?

다자이너니까 UX/UI 디자인 쯤이야! 웹 퍼블리싱 vue.js

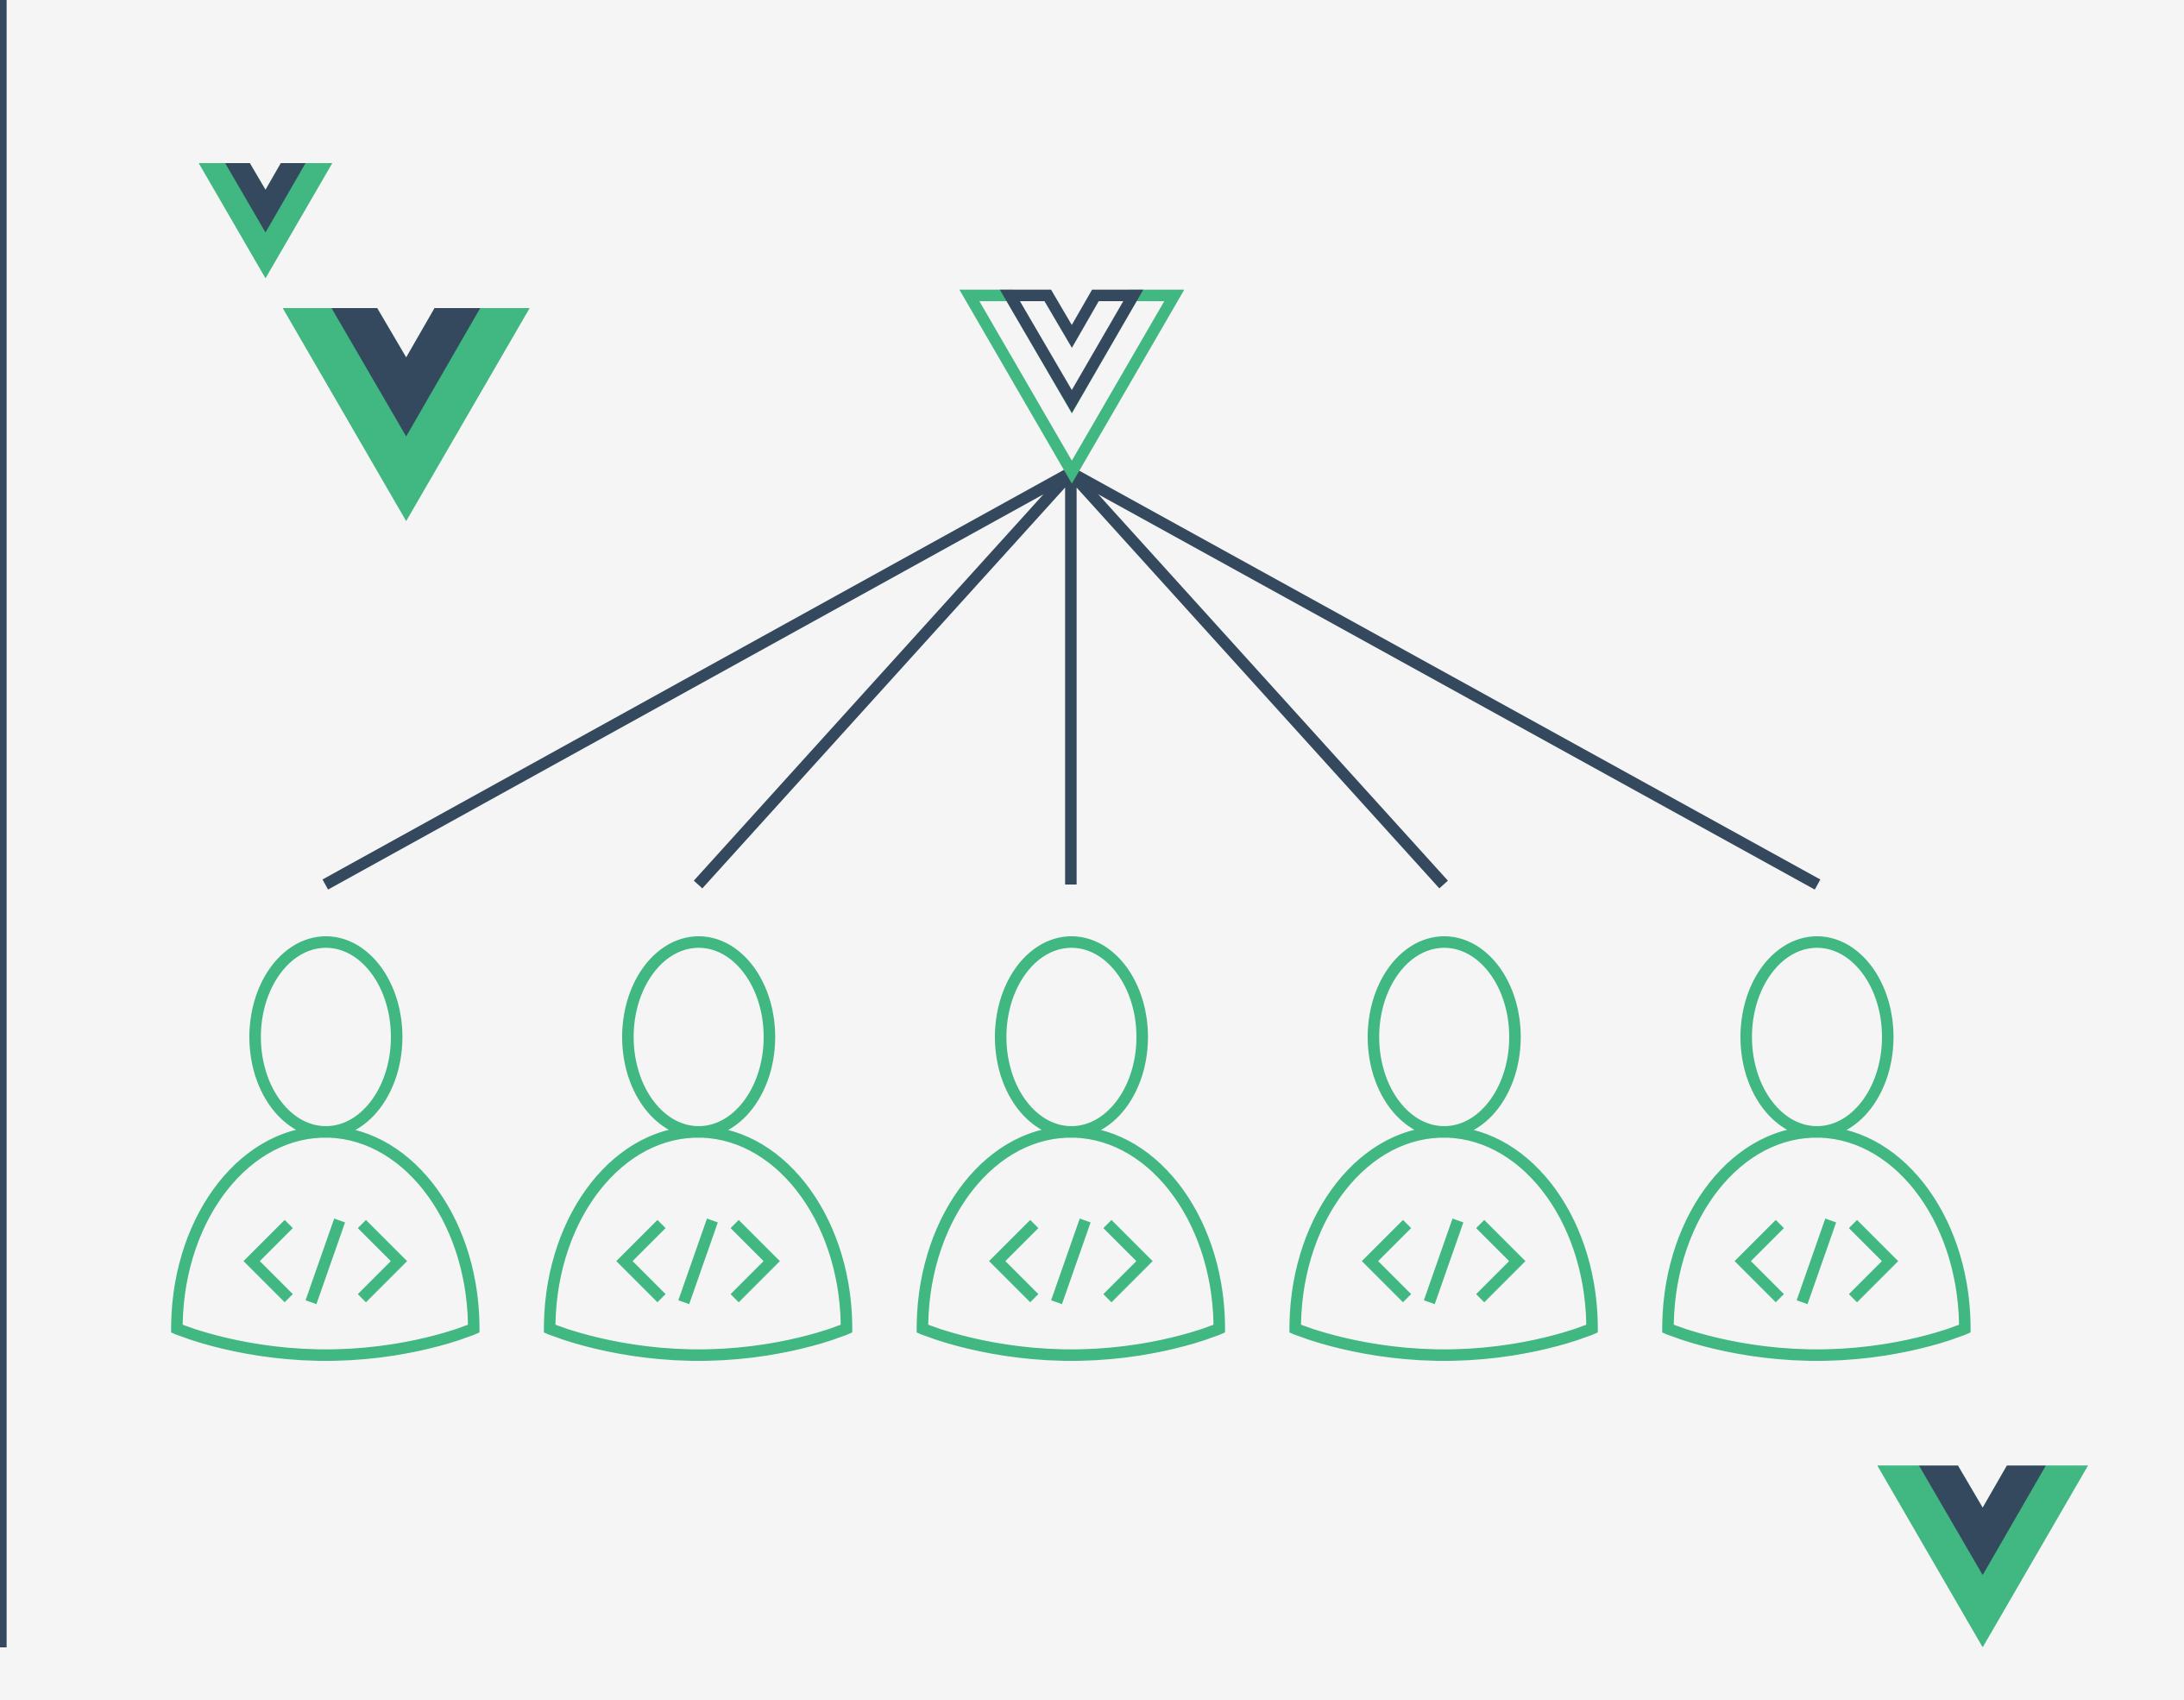

개발자에게 친절한 디자이너?

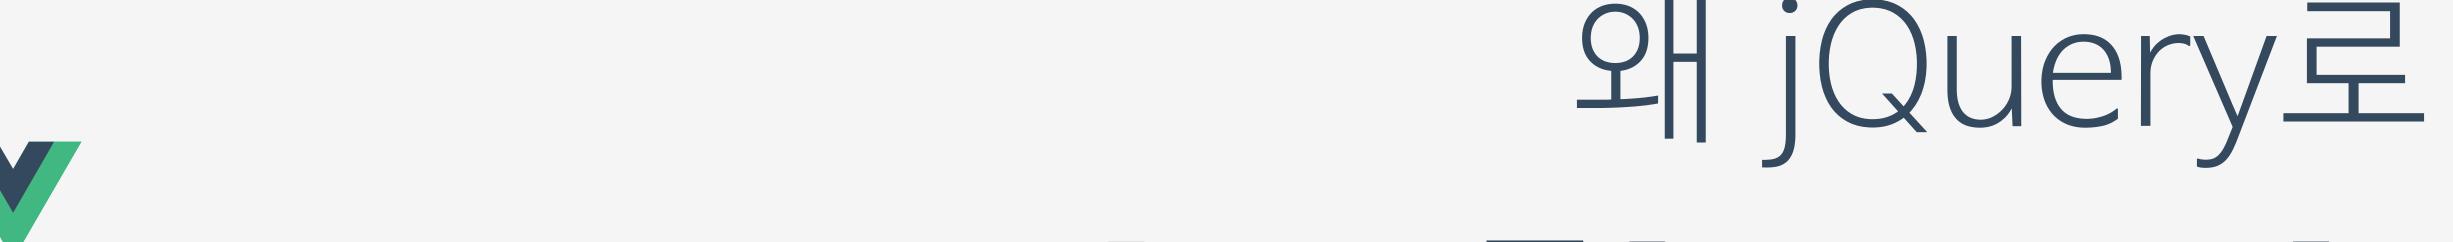

CSS는 제가 만질게요. API input과 output은 이렇게 해주세요.

7-CO7

쉽고 간단하게 JavaScript 쓰기?

시간이 없지만 공부 쫌이야!

Introduction

Vue (pronounced /vju:/, like view) is a progressive framework for building user interfaces. Unlike other monolithic frameworks, Vue is designed from the ground up to be incrementally adoptable. The core library is focused on the view layer only, and is very easy to pick up and integrate with other libraries or existing projects. On the other hand, Vue is also perfectly capable of powering sophisticated Single-Page Applications when used in combination with modern tooling and

If you are an experienced frontend developer and want to know how Vue compares to other libraries/frameworks, check out the Comparison with Other Frameworks

Getting Started

HTML, CSS, and JavaScript. If you are totally new to frontend development, it might not be the best idea to jump right into a framework as your first step - grasp the basics then come back! Prior experience with other frameworks helps, but is not

The official guide assumes intermediate level knowledge of

The easiest way to try out Vue.js is using the JSFiddle Hello World example. Feel free to open it in another tab and follow along as we go through some basic examples. Or, you can simply create an .html file and include Vue with:

```
<script src="https://unpkg.com/vue"></script>
```

The Installation page provides more options of installing Vue. Note that we do not recommend beginners to start with vue-cli, especially if you are not yet familiar with Node.js-based build tools.

Declarative Rendering

At the core of Vue.js is a system that enables us to declaratively render data to the DOM using straightforward template syntax:

```
<div id="app">
{{ message }}
</div>
var app = new Vue({
  el: '#app',
  data: {
    message: 'Hello Vue!'
Hello Vue!
```

We have already created our very first Vue app! This looks pretty similar to just rendering a string template, but Vue has done a lot of work under the hood. The data and the DOM are now linked, and everything is now reactive. How do we know? Just open your browser's JavaScript console (right now, on this page) and set app.message to a different value. You should see the rendered example above update accordingly.

In addition to text interpolation, we can also bind element attributes

```
<div id="app-2">
  <span v-bind:title="message">
   Hover your mouse over me for a few seconds
    to see my dynamically bound title!
var app2 = new Vue({
  el: '#app-2',
    message: 'You loaded this page on ' + new [
Hover your mouse over me for a few seconds to see my
dynamically bound title!
```

Here we are encountering something new. The v-bind attribute you are seeing is called a directive. Directives are prefixed with V- to indicate that they are special attributes provided by Vue, and as you may have guessed, they apply special reactive behavior to the

If you open up your JavaScript console again and enter

app2.message = 'some new message', you'll once again

rendered DOM. Here it is basically saying "keep this element's title attribute up-to-date with the message property on the Vue

Conditionals and Loops

<div id="app-3">

been updated.

```
It's quite simple to toggle the presence of an element, too:
```

Now you see me

see that the bound HTML - in this case the title attribute - has

```
el: '#app-6',
data: {
 message: 'Hello Vue!'
```

{{ message }}

r app3 = new Vue({ el: '#app-3',	JS	Hello Vue! Hello Vue!
data: {		
seen: true }		Composing with Components

Go ahead and enter app3.seen = false in the console. You should see the message disappear.

This example demonstrates that we can bind data to not only text and attributes, but also the structure of the DOM. Moreover, Vue also provides a powerful transition effect system that can automatically apply transition effects when elements are inserted/updated/removed

There are quite a few other directives, each with its own special functionality. For example, the V-for directive can be used for displaying a list of items using the data from an Array:

```
<div id="app-4">
  v-for="todo in todos">
   {{ todo.text }}
  </01>
```

```
var app4 = new Vue({
 el: '#app-4',
  data: {
     { text: 'Learn JavaScript' },
      { text: 'Learn Vue' },
      / tavt: 'Ruild comathing awacoma' .
```

 Learn JavaScript Learn Vue Build something awesome

In the console, enter

app4.todos.push({ text: 'New item' }).You should see a new item appended to the list.

Handling User Input

To let users interact with your app, we can use the V-On directive to attach event listeners that invoke methods on our Vue instances:

```
<div id="app-5">
  {{ message }}
  <button v-on:click="reverseMessage">Reverse !
var app5 = new Vue({
  el: '#app-5',
   message: 'Hello Vue.js!'
   reverseMessage: function () {
     this.message = this.message.split('').rev
Reverse Message
```

Note in the method we simply update the state of our app without touching the DOM - all DOM manipulations are handled by Vue, and the code you write is focused on the underlying logic.

Vue also provides the V-model directive that makes two-way binding between form input and app state a breeze:

<div id="app-6">

<input v-model="message"> </div>

```
var app6 = new Vue({
```

Vue!		
Vue!		

The component system is another important concept in Vue, because it's an abstraction that allows us to build large-scale applications composed of small, self-contained, and often reusable components. If we think about it, almost any type of application interface can be abstracted into a tree of components:

In Vue, a component is essentially a Vue instance with pre-defined options. Registering a component in Vue is straightforward:

```
// Define a new component called todo-item
Vue.component('todo-item', {
 template: 'This is a todo
```

Now you can compose it in another component's template:

```
<!-- Create an instance of the todo-item com;
 <todo-item></todo-item>
</01>
```

But this would render the same text for every todo, which interesting. We should be able to pass data from the pare ope into child components. Let's modify the component defin accept a prop:

Vue.component('todo-item', { // The todo-item component now accepts // "prop", which is like a custom attribute. // This prop is called todo. props: ['todo'], template: '{{ todo.text }}'

Now we can pass the todo into each repeated component using

```
<div id="app-7">
   <!-- Now we provide each todo-item with the
   <!-- it's representing, so that its content
   <todo-item v-for="item in groceryList" v-b:
 </div>
Vue.component('todo-item', {
 props: ['todo'],
  template: '{{ todo.text }}'
var app7 = new Vue({
 el: '#app-7',
   groceryList: [
     { text: 'Vegetables' }
      { text: 'Cheese' },
       { text: 'Whatever else humans are suppos
```

Whatever else humans are supposed to eat

Vegetables

Cheese

This is just a contrived example, but we have managed to separate our app into two smaller units, and the child is reasonably well-decoupled from the parent via the props interface. We can now further improve our <todo-item> component with more complex template and logic without affecting the parent app.

3. Whatever else humans are supposed to eat // ... and vice-versa data.a = 3vm.a // -> 3 This is just a contrived example, but we have managed to separate our app into two smaller units, and the child is reasonably well-decoupled

Cheese

<div id="app">

<app-view>

</app-view>

#Relation to Custom Elements

</div>

Ready for More?

Vue constructor function:

var vm = new Vue({

// options

<app-nav></app-nav>

<app-sidebar></app-sidebar>

<app-content></app-content>

You may have noticed that Vue components are very similar to Custom

because Vue's component syntax is loosely modeled after the spec. For

Elements, which are part of the Web Components Spec. That's

example, Vue components implement the Slot API and the 18

The Web Components Spec is still in draft status, and is not

supported browsers (IE9 and above). When needed, Vue

natively implemented in every browser. In comparison, Vue

components don't require any polyfills and work consistently in all

components can also be wrapped inside a native custom element.

Vue components provide important features that are not available.

in plain custom elements, most notably cross-component data

flow, custom event communication and build tool integrations

We've just briefly introduced the most basic features of Vue.js core -

much finer details, so make sure to read through it all!

the rest of this guide will cover them and other advanced features with

Although not strictly associated with the MVVM pattern, Vue's design

When you instantiate a Vue instance, you need to pass in an options

The Vue constructor can be extended to create reusable component

// all instances of `MyComponent` are created i

var myComponentInstance = new MyComponent()

Although it is possible to create extended instances imperatively, most

of the time it is recommended to compose them declaratively in

templates as custom elements. We will talk about the component

system in detail later. For now, you just need to know that all Vue

Each Vue instance proxies all the properties found in its data object:

// setting the property also affects original (

components are essentially extended Vue instances.

Properties and Methods

var data = { a: 1 }

vm.a === data.a // -> true

var vm = new Vue({

data: data

// the pre-defined extension options

object which can contain options for data, template, element to

mount on, methods, lifecycle callbacks and more. The full list of

was partly inspired by it. As a convention, we often use the variable

Vm (short for ViewModel) to refer to our Vue instances.

options can be found in the API reference.

constructors with pre-defined options:

var MyComponent = Vue.extend({

// extension options

special attribute. However, there are a few key differences:

from the parent via the props interface. We can now further improve our <todo-item> component with more complex template and It should be noted that only these proxied properties are reactive. If logic without affecting the parent app. you attach a new property to the instance after it has been created, it will not trigger any view updates. We will discuss the reactivity system In a large application, it is necessary to divide the whole app into components to make development manageable. We will talk a lot

more about components later in the guide, but here's an (imaginary) In addition to data properties, Vue instances expose a number of example of what an app's template might look like with components: useful instance properties and methods. These properties and methods are prefixed with 💲 to differentiate them from proxied data properties. For example:

data.a // -> 2

```
var data = { a: 1 }
var vm = new Vue({
  el: '#example'
  data: data
vm.$data === data // -> true
vm.$el === document.getElementById('example')
```

Don't use arrow functions on an instance property or callback vm.\$watch('a', newVal => this.myMethod())). As arrow functions are bound to the parent context, this will not be the Vue instance as you'd expect and this.myMethod will be undefined.

// \$watch is an instance method

vm.\$watch('a', function (newVal, oldVal) {

// this callback will be called when `vm.a` (

Consult the API reference for the full list of instance properties and methods.

Instance Lifecycle Hooks

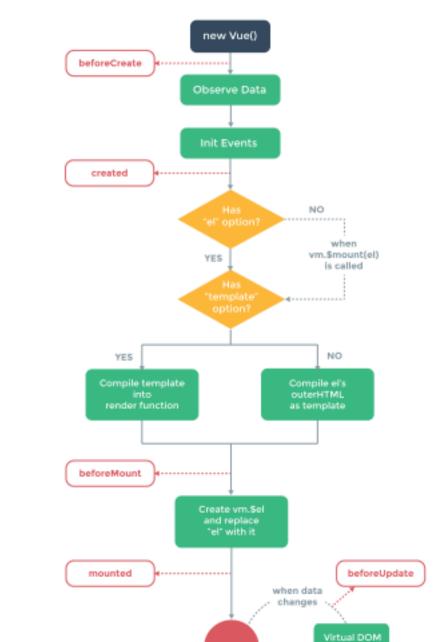

Each Vue instance goes through a series of initialization steps when it is created - for example, it needs to set up data observation, compile e template, mount the instance to the DOM, and up

```
// -> "a is: 1"
```

There are also other hooks which will be called at different stages of the instance's lifecycle, for example mounted, updated, and destroyed . All lifecycle hooks are called with their this context pointing to the Vue instance invoking it. You may have been wondering where the concept of "controllers" lives in the Vue world and the answer is: there are no controllers. Your custom logic for a component would be split among these lifecycle hooks.

Lifecycle Diagram

Below is a diagram for the instance lifecycle. You don't need to fully understand everything going on right now, but this diagram will be helpful in the future.

Template Syntax

Vue.js uses an HTML-based template syntax that allows you to declaratively bind the rendered DOM to the underlying Vue instance's data. All Vue.js templates are valid HTML that can be parsed by speccompliant browsers and HTML parsers.

Under the hood, Vue compiles the templates into Virtual DOM render functions. Combined with the reactivity system, Vue is able to intelligently figure out the minimal amount of components to rerender and apply the minimal amount of DOM manipulations when the app state changes.

If you are familiar with Virtual DOM concepts and prefer the raw power of JavaScript, you can also directly write render functions instead of templates, with optional JSX support.

The most basic form of data binding is text interpolation using the "Mustache" syntax (double curly braces):

```
<span>Message: {{ msg }}</span>
```

The mustache tag will be replaced with the value of the msg property on the corresponding data object. It will also be updated whenever the data object's **msg** property changes.

You can also perform one-time interpolations that do not update on data change by using the v-once directive, but keep in mind this will also affect any binding on the same node:

```
<span v-once>This will never change: {{ msg }}
```

#Raw HTML

The double mustaches interprets the data as plain text, not HTML. In order to output real HTML, you will need to use the V-html directive:

```
re inserted as plain HTML - 🛑 bindings are ignored.
 annot use v-html to con ee template partials,
 preferred as the
```

es. Only use HTML interpolation on trusted content and never on user-provided content.

Mustaches cannot be used inside HTML attributes, instead use a vbind directive:

```
<div v-bind:id="dynamicId"></div>
```

It also works for boolean attributes - the attribute will be removed if the condition evaluates to a falsy value:

```
<button v-bind:disabled="someDynamicCondition"</pre>
```

#Using JavaScript Expressions

So far we've only been binding to simple property keys in our templates. But Vue.js actually supports the full power of JavaScript expressions inside all data bindings:

```
{{ number + 1 }}
{{ ok ? 'YES' : 'NO' }}
{{ message.split('').reverse().join('') }}
<div v-bind:id="'list-' + id"></div>
```

These expressions will be evaluated as JavaScript in the data scope of the owner Vue instance. One restriction is that each binding can only contain one single expression, so the following will NOT work:

```
<!-- flow control won't work either, use ternal
{{ if (ok) { return message } }}
```

Template expressions are sandboxed and only have access to a

whitelist of globals such as Math and Date . You should not

attempt to access user defined globals in template expressions.

<!-- this is a statement, not an expression:

Interpolations

```
div v-html="rawHtml"></div>
```

{{ var a = 1 }}

second argument, and the value of expression arg2 will be evaluated and passed in as the third argument.

Directives are special attributes with the V- prefix. Directive attribute values are expected to be a single JavaScript expression (with the exception for v-for, which will be discussed later). A directive's job is to reactively apply side effects to the DOM when the value of its expression changes. Let's review the example we saw in the

attempt to access user defined globals in template expressions.

```
Now you see me
```

Here, the V-if directive would remove/insert the element based on the truthiness of the value of the expression seen.

#Arguments

directive name. For example, the V-bind directive is used to reactively update an HTML attribute:

Some directives can take an "argument", denoted by a colon after the

```
<a v-bind:href="url"></a>
Here href is the argument, which tells the v-bind directive to
```

bind the element's href attribute to the value of the expression url.

Another example is the V-On directive, which listens to DOM events

<a v-on:click="doSomething">

```
Here the argument is the event name to listen to. We will talk about
event handling in more detail too.
```

Modifiers are special postfixes denoted by a dot, which indicate that a directive should be bound in some special way. For example, the .prevent modifier tells the V-On directive to call event.preventDefault() on the triggered event:

```
<form v-on:submit.prevent="onSubmit"></form>
```

page on Github! use of modifiers later when we take a more thorough

text formatting. Filters are usable in two places: mustache interpolations and v-bind expressions. Filters should be appended to the end of the JavaScript expression, denoted by the "pipe" symbol:

you to define filters that can be used to apply common

```
<!-- in mustaches -->
{{ message | capitalize }}
<!-- in v-bind -->
 <div v-bind:id="rawId | formatId"></div>
```

Vue 2.x filters can only be used inside mustache interpolations and v-bind expressions (the latter supported since 2.1.0), because filters are primarily designed for text transformation purposes. For more complex data transforms in other directives, you should use Computed properties instead.

The filter function always receives the expression's value as the first

```
new Vue({
  filters: {
   capitalize: function (value) {
     if (!value) return
      value = value.toString()
      return value.charAt(0).toUpperCase() + va
```

Filters can be chained:

```
Filters are JavaScript functions, therefore they can take arguments:
```

{{ message | filterA('arg1', arg2) }}

{{ message | filterA | filterB }}

Here, the plain string 'arg1' will be passed into the filter as the

```
Original message: "Hello"
```

Computed reversed message: "olleH"

Here we have declared a computed property reversedMessage The function we provided will be used as the getter function for the property Vm.reversedMessage

Filters are JavaScript functions, therefore they can take arguments

{{ message | filterA('arg1', arg2) }}

Here, the plain string 'arg1' will be passed into the filter as the

second argument, and the value of expression arg2 will be

The V- prefix serves as a visual cue for identifying Vue-specific

to apply dynamic behavior to some existing markup, but can feel

an SPA where Vue.js manages every template. Therefore, Vue.js

verbose for some frequently used directives. At the same time, the

need for the V- prefix becomes less important when you are building

provides special shorthands for two of the most often used directives,

attributes in your templates. This is useful when you are using Vue.js

evaluated and passed in as the third argument.

Shorthands

v-bind and v-on:

</div>

<div id="example">

<div id="example">

var vm = new Vue({

el: '#example',

computed: {

message: 'Hello'

// a computed getter

reversedMessage: function () {

// `this` points to the vm instance

return this.message.split('').reverse().;

data: {

<a @click="doSomething">

<a v-bind:href="url">

```
console.log(vm.reversedMessage) // -> 'olleH'
vm.message = 'Goodbye'
console.log(vm.reversedMessage) // -> 'eybdooG
```

You can open the console and play with the example vm yourself. The value of Vm.reversedMessage is always dependent on the value of vm.message.

You can data-bind to computed properties in templates just like a normal property. Vue is aware that Vm. reversedMessage depends on Vm.message, so it will update any bindings that depend on Vm.reversedMessage when Vm.message changes. And the best part is that we've created this dependency relationship declaratively: the computed getter function has no side effects, which makes it easy to test and reason about.

#Computed Caching vs Methods

```
You may have noticed we can achieve the same result by invoking a
 method in the expression:
```

```
Reversed message: "{{ reverseMessage() }}"<</p>
// in component
methods: {
  reverseMessage: function () {
    return this.message.split('').reverse().jo:
```

Instead of a computed property, we can define the same function as a method instead. For the end result, the two approaches are indeed exactly the same. However, the difference is that computed properties are cached based on their dependencies. A computed property will only re-evaluate when some of its dependencies have changed. This means as long as message has not changed, multiple access to the reversedMessage computed property will immediately return the previously computed result without having to run the function again.

This also means the following computed property will never update, because Date.now() is not a reactive dependency

```
computed: {
 now: function () {
   return Date.now()
```

In comparison, a method invocation will always run the function whenever a re-render happens.

Why do we need caching? Imagine we have an expensive computed property A, which requires looping through a huge Array and doing a lot of computations. Then we may have other computed properties that in turn depend on A. Without caching, we would be executing A's getter many more times than necessary! In cases where you do not want caching, use a method instead.

#Computed vs Watched Property

var vm = new Vue({

el: '#demo',

Vue does provide a more generic way to observe and react to data changes on a Vue instance: watch properties. When you have some data that needs to change based on some other data, it is tempting to overuse Watch - especially if you are coming from an AngularJS background. However, it is often a better idea to use a computed property rather than an imperative Watch callback. Consider this example:

```
<div id="demo">{{ fullName }}</div>
```

data: { firstName: 'Foo', lastName: 'Bar', fullName: 'Foo Bar watch: { firstName: function (val) { this.fullName = val + ' ' + this.lastName lastName: function (val) { this.fullName = this.firstName + ' ' + va

computed property version:

The above code is imperative and repetitive. Compare it with a

var vm = new Vue({

Vue.js를

Setup하는 방법?

만드는 방법?

Vue instance

data object

```
1  new Vue({
2   el: "#app",
3   data: {
4    playerHealth: 100,
5    monsterHealth: 100,
6    gameIsRunning: false
7   }
8  });
```

template syntax

{{textInterpolation}}

binding inline styles

v-bind:style,:style

conditional rendering

v-if, v-else

template syntax directives

v-on:click, @click

```
<div class="small-12 columns">
     <button id="start-game" @click="startGame">시작</button>
</div>
```

Vue instance

methods

```
methods: {
    startGame: function() {
        this.gameIsRunning = true;
        //initialize healthbars
        this.playerHealth = 100;
        this.monsterHealth = 100;
        //initialize turns
        this.turns = [];
    },
```

쉽네? 공부하면 되지!

시간이 없지만 공부 쫌이야!

Vue. js &

JavaScript

```
attack: function() {
    //player attacks

    var damage = this.calculateDamage(3, 10);
    this.monsterHealth -= damage;
    this.turns.unshift({
        isPlayer: true,
        text: 'smilee가 vue.js에게 ' + damage + '의 피해를 입혔습니다.'
    });

    //check if the player won
    if (this.checkWin()) {
        return;
    }

    this.monsterAttacks();
},
```

공부만으로는 안돼? **밤을 새면 되지!**

피곤하지만 밤샘 쬼이야!

Vue. js &

JavaScript

```
specialAttack: function() {
    //player attacks
    var damage = this.calculateDamage(10, 20);
    this.monsterHealth -= damage;
    this.turns.unshift({
        isPlayer: true,
        text: 'smilee가 vue.js에게 *' + damage + '*의 피해를 입혔습니다.'
    });
    //check if the player won
    if (this.checkWin()) {
        return;
    }
    this.monsterAttacks();
},
```

일주일 밤샘 쯤이야... 힘드네. 낯잠을 자볼까?

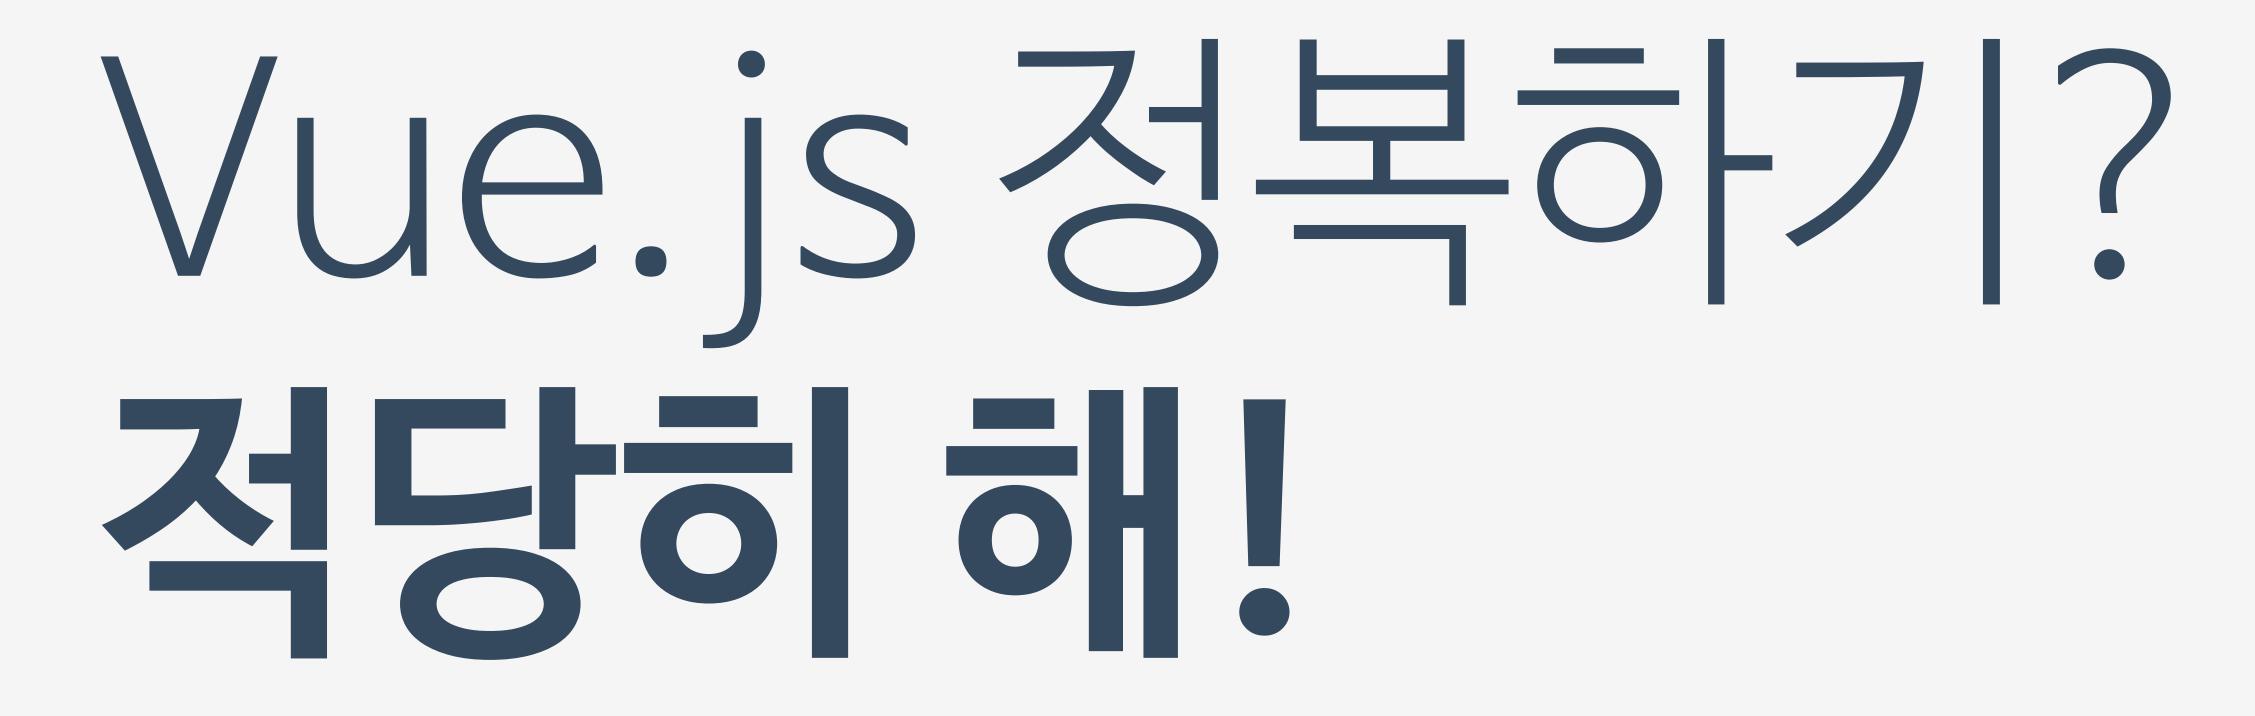

Vue. js &

JavaScript

```
heal: function() {
  if (this.playerHealth <= 90) {
    this.playerHealth += 10;
  } else {
    this.playerHealth = 100;
  }
  this.turns.unshift({
    isPlayer: true,
    text: 'smilee가 ' + 10 + '의 피해를 회복했습니다.'
  });
  this.monsterAttacks();
},
```

이렇게살바에는 포기가...

Vue. js &

JavaScript

```
giveUp: function() {
  this.gameIsRunning = false;
},
```

Vue.js 꼭 무찌를거야!

list rendering

V-for

감사합니다!
